(Descriptions)
•Flood related information illustrated in the map is calculated by simulating immersion areas, flood depth, and flood duration as- surmed in case of sewer and small and medium-sized river (rivers unexpected to flood in the Flood Hazard Map) floods due to the maximum possible rainfall (156mm/h, 836mm/24h), considering the development status of facilities as of the end of FY2020.
•The simulations consider shutdown of drain pumps and closing of sluice gates associated with river level rise.
•Immersion areas, flood depth, and flood duration are only as- sumptions and they may largely exceed the assumptions de- pending on various conditions.
•The map has been created based on the results of simulations conducted by Nagoya City.
